Course Code: DSA0601

Slot: A

Course Name: Data Handling and Visualization

Course Faculty: Dr S Senthilvadivu

Project Title: Design of a Fashion Retail Trend and Seasonal Demand Visualization Platform

Module Photographs:

Project Description:

The project, “Design of a Fashion Retail Trend and Seasonal Demand Visualization Platform,” focuses on analyzing fashion sales and customer demand. It helps identify popular fashion trends and understand how product demand changes across different seasons. The platform presents the analyzed data through simple visualizations, making it easy for retailers to understand trends and make better decisions.

My Contribution-Module 2 – Seasonal Demand Distribution & Proportion

Analyzes fashion sales according to different seasons such as Spring, Summer, Autumn, and Winter. The purpose is to understand how sales demand varies between seasons and identify categories or styles that contribute significantly to overall sales. Violin plots are used to study sales distribution and variation across seasons, while category and style proportions help understand their contribution to total sales.
